# MATHEMATICS 14–24

---

## **PROGRAM RATIONALE AND PHILOSOPHY**

The need for and use of mathematics in our daily lives is changing. This necessitates a change in the emphasis of mathematics education. The emphasis has shifted from the memorization of mathematical formulae and algorithms to the use of mathematics to reason, interpret and explore. The focus is on developing students' mathematical knowledge, skills and attitudes through a problem-solving approach. More than ever before, students must become creative and logical thinkers, data managers and problem solvers. They must develop communication skills and be cooperative and interactive to cope with daily life today and tomorrow.

The use of technology is increasing in importance in our society. This is reflected in our mathematics curriculum. The integration of technology into the mathematics classroom allows students to use computers and calculators to provide quick and accurate computation and manipulation, to enhance conceptual understanding, and to facilitate higher order thinking.

Students have to understand how mathematical concepts permeate daily life, business and industry. They have to be given real-world activities and problems so they can make connections between classroom learning and the world in which they live. Students need to be exposed to varied, interrelated experiences that encourage them to understand and appreciate the role of mathematics in our society.

The Mathematics 14–24 program is derived from *The Common Curriculum Framework for K–12 Mathematics: Western Canadian Protocol for Collaboration in Basic Education*, 1995, and *The Common Curriculum Framework for K–12 Mathematics Grade 10 to Grade 12: Western Canadian Protocol for Collaboration in Basic Education*, 1996. Outcomes have been modified as needed. The Mathematics 14–24 sequence is designed for students whose needs, interests and abilities focus on basic mathematical understanding. The emphasis is on the acquisition of practical life skills and proficiency in using mathematics to solve problems, accommodate change, interpret information and create new knowledge within meaningful contexts.

## **BELIEFS ABOUT STUDENTS AND MATHEMATICS LEARNING**

*Students must construct their own meaning of mathematics.*

Students are curious, active learners who have individual interests, abilities and needs. They come to classrooms with different knowledge, life experiences and backgrounds that generate a range of attitudes about mathematics and life.

Students learn by attaching meaning to what they do; and they must be able to construct their own meaning of mathematics. This meaning is best developed when learners encounter mathematical experiences that proceed from the simple to the complex and from the concrete to the abstract. The use of manipulatives can address the diversity of learning styles and developmental stages of students and can enhance the formation of sound, transferable, mathematical concepts. At all levels, students benefit from working with appropriate materials, tools and contexts when constructing personal meaning about new mathematical ideas. The learning environment should value and respect each student's way of thinking, so that the learner feels comfortable in taking intellectual risks, asking questions and posing conjectures.

Mathematics is a common human activity, increasing in importance in a rapidly advancing, technological society. Proficiency in using mathematics increases the opportunities available to individuals. Students need to become mathematically literate in order to explore problem-solving situations, accommodate changing conditions and actively create new knowledge in striving for self-fulfillment.

## GOALS FOR STUDENTS

*Mathematics education must prepare students to use mathematics to solve problems.*

The main goals of mathematics education are to prepare students to:

- use mathematics confidently to solve problems
- communicate and reason mathematically
- appreciate and value mathematics
- commit themselves to lifelong learning
- become mathematically literate adults, using mathematics to contribute to society.

*Positive attitudes toward mathematics are important.*

At the completion of a program, students should have developed a positive attitude toward mathematics and have a base of knowledge and

skills related to number, patterns and relations, shape and space, and statistics and probability.

It is important for students to develop a positive attitude toward mathematics so that they can become confident in their ability to undertake the problems of a changing world, thereby experiencing the power and usefulness of mathematics. Students also should gain an understanding and appreciation of the contributions of mathematics, as a science and as an art, to civilization and to culture.

Students should:

- exhibit a positive attitude toward mathematics
- engage and persevere in mathematical tasks and projects
- contribute to mathematical discussions
- take risks in performing mathematical tasks
- exhibit curiosity
- show enjoyment of mathematical experiences.

All students should receive a level of mathematics education appropriate to their needs and abilities.

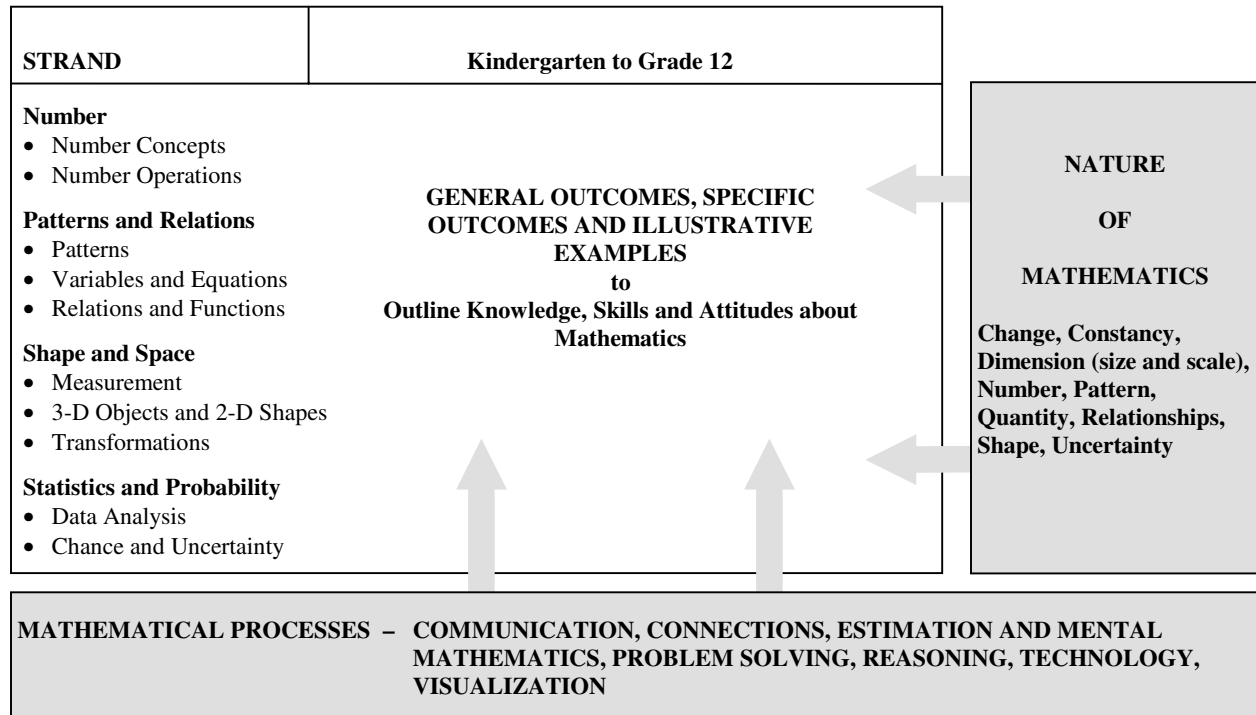

# CONCEPTUAL FRAMEWORK FOR K-12 MATHEMATICS

This framework summarizes the philosophical view toward mathematics and mathematics education.

Students of mathematics, regardless of age or experience, strive to do mathematics in settings that are new to them. The conceptual framework

outlined in this section presents a multifaceted view of mathematics and presents the discipline as skills, procedures and concepts woven together.

The framework chart below shows how student outcomes, organized by grade and strand, are designed to be influenced by Mathematical Processes and the Nature of Mathematics. These components are described more fully in this section.

## MATHEMATICAL PROCESSES

There are critical components that students must encounter in a mathematics program in order to achieve the goals of mathematics education and to encourage lifelong learning in mathematics. Students are expected to:

- *Communication* [C]
  - *Connections* [CN]
  - *Estimation and Mental Mathematics* [E]
  - *Problem Solving* [PS]
  - *Reasoning* [R]
  - *Technology* [T]
  - *Visualization* [V]
- communicate mathematically
  - connect mathematical ideas to other concepts in mathematics, to everyday experiences and to other disciplines
  - use estimation and mental mathematics where appropriate
  - relate and apply new mathematical knowledge through problem solving
  - reason and justify their thinking
  - select and use appropriate technologies as tools to solve problems
  - use visualization to assist in processing information, making connections and solving problems.

This program of studies incorporates these seven interrelated mathematical processes that are intended to permeate teaching and learning.

**Communication**

*Students must be able to communicate effectively how an answer was obtained.*

Students need to communicate mathematical ideas clearly and effectively, orally and in writing.

Communication will help students make connections among different representations of mathematical ideas; namely, “physical, pictorial, graphic, symbolic, verbal and mental representations.” (NCTM, p. 26)

**NCTM COMMUNICATION STANDARDS**

K–4	5–8	9–12
<p><i>The study of mathematics should include numerous opportunities for communication so that students can:</i></p>	<p><i>The study of mathematics should include opportunities to communicate so that students can:</i></p>	<p><i>The mathematics curriculum should include the continued development of language and symbolism to communicate mathematical ideas so that all students can:</i></p>
<ul style="list-style-type: none"> <li>• relate physical materials, pictures, and diagrams to mathematical ideas</li> <li>• reflect on and clarify their thinking about mathematical ideas and situations</li> <li>• relate their everyday language to mathematical language and symbols</li> <li>• realize that representing, discussing, reading, writing, and listening to mathematics are a vital part of learning and using mathematics.</li> </ul>	<ul style="list-style-type: none"> <li>• model situations using oral, written, concrete, pictorial, graphical, and algebraic methods</li> <li>• reflect on and clarify their own thinking about mathematical ideas and situations</li> <li>• develop common understandings of mathematical ideas, including the role of definitions</li> <li>• use the skills of reading, listening, and viewing to interpret and evaluate mathematical ideas</li> <li>• discuss mathematical ideas and make conjectures and convincing arguments</li> <li>• appreciate the value of mathematical notation and its role in the development of mathematical ideas.</li> </ul>	<ul style="list-style-type: none"> <li>• reflect upon and clarify their thinking about mathematical ideas and relationships</li> <li>• formulate mathematical definitions and express generalizations discovered through investigations</li> <li>• express mathematical ideas orally and in writing</li> <li>• read written presentations of mathematics with understanding</li> <li>• ask clarifying and extending questions related to mathematics they have read or heard about</li> <li>• appreciate the economy, power, and elegance of mathematical notation and its role in the development of mathematical ideas.</li> </ul>

(NCTM, p. 26)

(NCTM, p. 78)

(NCTM, p. 140)

## Connections

*Through connections students should begin to view mathematics as an integrated whole.*

Students need numerous and varied experiences in order to appreciate the usefulness of mathematics and, at the same time, to explore connections within mathematics, from mathematics to other disciplines, and from mathematics to their daily experiences. When mathematical ideas are connected to each other through concrete, pictorial

and symbolic representations, students begin to view mathematics as an integrated whole.

This integration “allows students to see how one mathematical idea can help them understand others, and it illustrates the subject’s usefulness in solving problems, describing and modeling real-world phenomena, and communicating complex thoughts and information in a concise and precise manner.” (NCTM, p. 94)

### NCTM CONNECTIONS STANDARDS

K–4	5–8	9–12
<i>The study of mathematics should include opportunities to make connections so that students can:</i>	<i>The mathematics curriculum should include the investigation of mathematical connections so that students can:</i>	<i>The mathematics curriculum should include investigation of the connections and interplay among various mathematical topics and their applications so that all students can:</i>
<ul style="list-style-type: none"> <li>• link conceptual and procedural knowledge</li> <li>• relate various representations of concepts or procedures to one another</li> <li>• recognize relationships among different topics in mathematics</li> <li>• use mathematics in other curriculum areas</li> <li>• use mathematics in their daily lives.</li> </ul>	<ul style="list-style-type: none"> <li>• see mathematics as an integrated whole</li> <li>• explore problems and describe results using graphical, numerical, physical, algebraic, and verbal mathematical models or representations</li> <li>• use a mathematical idea to further their understanding of other mathematical ideas</li> <li>• apply mathematical thinking and modeling to solve problems that arise in other disciplines, such as art, music, psychology, science, and business</li> <li>• value the role of mathematics in our culture and society.</li> </ul>	<ul style="list-style-type: none"> <li>• recognize equivalent representations of the same concept</li> <li>• relate procedures in one representation to procedures in an equivalent representation</li> <li>• use and value the connections among mathematical topics</li> <li>• use and value the connections between mathematics and other disciplines.</li> </ul>
(NCTM, p. 32)	(NCTM, p. 84)	(NCTM, p. 146)

## Estimation and Mental Mathematics

*Mental mathematics is the cornerstone for estimation.*

Students need to know when and how to estimate. The context of a problem helps to determine when it is necessary or desirable to have an exact answer or an estimate of that answer. Problem contexts include number, patterns and relations, shape and space, and statistics and probability. The use of technology increases the emphasis on estimation skills to enable students to determine the reasonableness of computed answers.

A variety of estimation strategies assists students in arriving at quick approximations for exact answers.

Facility with mental mathematics is an important outcome for students. A focus on mental mathematics forces students to think and improve their efficiency and accuracy in calculating, including pencil and paper calculations. Mental mathematics is the cornerstone for estimation and leads to better understanding of number concepts and number operations. (Hope, pp. 161–173)

## Problem Solving

*Problem solving is the focus of mathematics at all grade levels.*

*“Problem solving—which includes the ways in which problems are represented, the meanings of the language of mathematics, and the ways in which one conjectures and reasons—must be central to schooling so that students can explore, create, accommodate to changed conditions, and actively create new knowledge over the course of their lives.” (NCTM, p. 4)*

Problem solving is the focus of mathematics at all grade levels. The development of each student’s ability to solve problems is essential. Students develop a true understanding of mathematical concepts and procedures when they solve problems in meaningful contexts. Problem solving is to be employed throughout all of mathematics and should be embedded throughout all of the strands.

Problem solving provides an opportunity for students to be active in constructing mathematical meaning, to learn problem-solving strategies, to practise a variety of concepts and skills in a meaningful context, and to communicate mathematical ideas. Most problem-solving

situations in the elementary years come from the everyday experiences of the student. Students are able to attach mathematical meaning to familiar activities. As they progress through school, the problems become more complex. The problems will arise from an exploration of mathematics itself, as well as from the world around them. Gradually, students become more confident in their ability to use and communicate mathematics, using correct terminology.

As students develop mathematically, they are able to solve more challenging problems on an increasing variety of topics. Students need the opportunity “to solve problems that require them to work cooperatively (and individually), to use technology, to address relevant and interesting mathematical ideas, and to experience the power and usefulness of mathematics.” (NCTM, pp. 75–76) By the time students reach the secondary level, many problem-solving strategies should be internalized and problem solving should be a process for constructing and reinforcing mathematical concepts.

Students should be confident and flexible problem solvers, using a wide range of strategies in their work, and accept that some problems have different solutions.

### NCTM PROBLEM-SOLVING STANDARDS

K–4	5–8	9–12
<i>The study of mathematics should emphasize problem solving so that students can:</i>	<i>The mathematics curriculum should include numerous and varied experiences with problem solving as a method of inquiry and application so that students can:</i>	<i>The mathematics curriculum should include the refinement and extension of methods of mathematical problem solving so that all students can:</i>
<ul style="list-style-type: none"> <li>• use problem-solving approaches to investigate and understand mathematical content</li> <li>• formulate problems from everyday and mathematical situations</li> <li>• develop and apply strategies to solve a wide variety of problems</li> <li>• verify and interpret results with respect to the original problem</li> <li>• acquire confidence in using mathematics meaningfully.</li> </ul>	<ul style="list-style-type: none"> <li>• use problem-solving approaches to investigate and understand mathematical content</li> <li>• formulate problems from situations within and outside mathematics</li> <li>• develop and apply a variety of strategies to solve problems, with emphasis on multistep and nonroutine problems</li> <li>• verify and interpret results with respect to the original problem situation</li> <li>• generalize solutions and strategies to new problem situations</li> <li>• acquire confidence in using mathematics meaningfully.</li> </ul>	<ul style="list-style-type: none"> <li>• use, with increasing confidence, problem-solving approaches to investigate and understand mathematical content</li> <li>• apply integrated mathematical problem-solving strategies to solve problems from within and outside mathematics</li> <li>• recognize and formulate problems from situations within and outside mathematics</li> <li>• apply the process of mathematical modeling to real-world problem situations.</li> </ul>
(NCTM, p. 23)	(NCTM, p. 75)	(NCTM, p. 137)

## Reasoning

*Reasoning helps students to make sense of mathematics and to be logical in their thinking.*

Students need to develop confidence in their ability to reason and to justify their thinking within and outside of mathematics. The power of reasoning helps students to make sense of mathematics, to be logical in their thinking, and to convince others.

Inductive reasoning helps students explore and make conjectures from activities that allow generalizations from a pattern of observations.

Deductive reasoning helps students test conjectures and build arguments that serve to validate thinking. Deductive reasoning builds a structured body of knowledge.

### NCTM REASONING STANDARDS

K–4	5–8	9–12
<i>The study of mathematics should emphasize reasoning so that students can:</i>	<i>Reasoning shall permeate the mathematics curriculum so that students can:</i>	<i>The mathematics curriculum should include numerous and varied experiences that reinforce and extend logical reasoning skills so that all students can:</i>
<ul style="list-style-type: none"> <li>• draw logical conclusions about mathematics</li> <li>• use models, known facts, properties, and relationships to explain their thinking</li> <li>• justify their answers and solution processes</li> <li>• use patterns and relationships to analyze mathematical situations</li> <li>• believe that mathematics makes sense.</li> </ul>	<ul style="list-style-type: none"> <li>• recognize and apply deductive and inductive reasoning</li> <li>• understand and apply reasoning processes, with special attention to spatial reasoning and reasoning with proportions and graphs</li> <li>• make and evaluate mathematical conjectures and arguments</li> <li>• validate their own thinking</li> <li>• appreciate the pervasive use and power of reasoning as a part of mathematics.</li> </ul>	<ul style="list-style-type: none"> <li>• make and test conjectures</li> <li>• formulate counterexamples</li> <li>• follow logical arguments</li> <li>• judge the validity of arguments</li> <li>• construct simple valid arguments.</li> </ul>
(NCTM, p. 29)	(NCTM, p. 81)	(NCTM, p. 143)

## Technology

*Technology will aid students in solving complex problems.*

Improvements in technology, and its increased availability in schools, have changed the focus of mathematics education. The time saved by using calculators or computers to perform complex calculations can be used to help students better understand mathematical concepts. Students can then understand the relationships among concepts and use these relationships to solve problems.

Calculators and computers can be used as tools to:

- develop concepts
- explore and demonstrate mathematical relationships and patterns
- organize and display data
- assist with solving problems and thus promote independence
- encourage students to be inquisitive and creative
- decrease the time spent on tedious computations
- reinforce the learning of basic number facts and properties
- develop an understanding of computational algorithms

- create geometric displays
- simulate situations.

In some cases, technology will allow teachers to ask questions requiring a high level of thinking and will allow students to solve complex, multifaceted problems. Technology can foster environments in which the growing curiosity of students can lead to rich mathematical discoveries. In these environments, the control of exploring mathematical ideas can be turned over to students.

### Visualization

*Images are useful in describing the physical and mathematical environment.*

Visualization “involves thinking in *pictures* and *images* and the ability to perceive, transform and re-create different aspects of the visual–spatial world.” (Armstrong, p. 10, italics in original) The use of images in the study of mathematics provides students with the opportunity to understand mathematical concepts and to make connections among them.

The physical environment is full of images. The images are of 3-D objects, 2-D shapes, 1-D lines and pictures. In geometry, the study of a 3-D object is assisted by visualizing either the net of 2-D shapes or the skeleton of 1-D lines required to construct the object.

The mathematical environment is full of images. These images are used to communicate mathematical concepts and multiple solutions to problems. At an elementary level, four piles, each containing three coins, can be used to represent  $3 + 3 + 3 + 3 = 12$ . Rearranging the piles into four rows of 3 can then be used to represent  $4 \times 3 = 12$ . Connecting the two images links the process of multiplication with that of repeated addition. At a more advanced level, analytic geometry describes figures algebraically and provides a tool for the visualization of algebraic relations. The analysis and interpretation of data, using a visual summary, aids in understanding the data and making predictions from it.

### NATURE OF MATHEMATICS

- *Change*
- *Constancy*
- *Dimension*
- *Number*
- *Pattern*
- *Quantity*
- *Relationships*
- *Shape*
- *Uncertainty*

By enriching our view of mathematics and the learning environment, the outcomes of the program of studies can be accomplished.

The brain is constantly looking for and making connections. “Because the learner is constantly searching for connections on many levels, educators need to orchestrate the experiences from which learners extract understanding. . . . Brain research establishes and confirms that multiple complex and concrete experiences are essential for meaningful learning and teaching.” (Caine, p. 5)

There are additional critical components that must be addressed in a mathematics program beyond those listed as mathematical processes. The components discussed are: Change, Constancy, Dimension (size and scale), Number, Pattern, Quantity, Relationships, Shape and Uncertainty. They are used to describe mathematics in a broad way in order to establish the wide variety of connections that can be made among the various strands used to organize the outcomes central to the program of studies.

### Change

*Change is a very broad concept. Students must become sensitive to patterns, such as linear, exponential, logarithmic and periodic.*

Change can be discussed from Kindergarten to Grade 12 across many aspects of mathematics. The study of change is often discussed in the context of calculus, but is often limited to this context. However, change is a much broader concept than that used in calculus. In order to

make predictions, students need to describe and quantify their observations, attempt to build patterns, and identify those quantities that remain fixed and those quantities that change. For example, look at the pattern 4, 6, 8, 10, 12,.... An elementary school student can describe this as skip counting by 2s, starting from 4. A senior high school student may describe this pattern as an arithmetic sequence, with first term 4, and a common difference of 2. Another student may describe it as a linear function with a discrete domain. All three interpretations are focusing on the changing size of the numbers within the sequence. To be able to understand change, students must become sensitive to patterns, such as linear, exponential, logarithmic and periodic. (Steen, p. 184)

### **Constancy**

*Constancy is described by the terms stability, conservation, equilibrium, steady state and symmetry.*

Students are expected to communicate ideas visually, using diagrams and oral and written words, when describing constancy or invariance. Different aspects of constancy “are described by the terms stability, conservation, equilibrium, steady state, and symmetry.” (AAAS–Benchmarks, p. 270) The most important properties in mathematics and science relate to those properties that do not change when outside conditions change. Elementary school students deal with constancy in situations where different methods are used to solve a single multiplication problem, such as finding the area of a 3-tile by 4-tile tabletop. Secondary students need to deal with constancy when they solve the more complicated multiplication problems that appear in determining the number of elements present in the sample spaces of probability problems. Many of these situations will involve permutations and combinations.

In geometry, a circle can be transformed into an ellipse by a simple stretch, and into a square by a more complex series of transformations; but there is no way that the circle can be transformed into a parabola. The closed figures, such as circles and

squares, remain closed and cannot be transformed into open figures, such as parabolas. Triangles can be distorted in many ways, but all will have an angle sum of  $180^\circ$ . The straight line is characterized as having all its parts with the same slope. In solving many of the most important problems in mathematics, students need to concentrate on the properties that remain constant. This idea enables students to solve problems involving constant rates of change, lines with constant slope, direct variation situations, or the angle sums of polygons.

### **Dimension (size and scale)**

*The concept of dimension needs to be developed within an environment of physical objects.*

The concept of dimension, most usually associated with 3-D objects, 2-D shapes or 1-D lines, needs to be developed within an environment of physical objects for all grades from Kindergarten to Grade 12. The prediction of the change in dimension of objects can be done using numbers attached to appropriate units. For example, with no knowledge of a formula, students in upper elementary grades can predict that doubling the side of a square generates four times the area. Junior and senior high school students need to be able to use algebraic structures to formalize this relationship.

Physical objects can all be described using measurement concepts. The development of perimeter, area and volume concepts relies on pattern recognition, not on memorization of formulas. Descriptions of geometric patterns (number of vertices, sides and edges of various 3-D objects, 2-D shapes and 1-D lines); and the angle sum of various 2-D shapes is also encouraged. This type of data should be placed in charts and/or graphs to help students visualize their findings and predict patterns.

## Number

*The use of number must include number sense.*

Number, number systems and the operations on numbers are vital to all mathematics learning. The use of number must go beyond procedure and accuracy to include what is called number sense. Number sense includes:

- an intuitive feeling about numbers and their multiple relationships
- construction of the meaning of number through a variety of experiences, and development of an appreciation of the need for numbers beyond whole numbers (NCTM, p. 38)
- an appreciation and ability to make quick order of magnitude approximations (Steen, p. 79) with emphasis on establishing quick and accurate estimations for computation and measurement
- the ability to detect arithmetic errors
- knowledge of place value and the effects of arithmetic operations.

Many numerical calculations are performed with calculators and computers, and students must be able to determine if the desired calculations have been done correctly. Students must plan for the efficient use of technological tools.

Number patterns should be recognized and used to count, to make predictions, to describe shapes and to compare.

## Pattern

*Mathematics is an exploratory science that seeks to understand every kind of pattern.*

“What humans do with the language of mathematics is to describe patterns. Mathematics is an exploratory science that seeks to understand every kind of pattern.” (Steen, p. 8) Patterns exist in number, geometry, algebra and data. By helping students recognize, extend, create and use patterns as a routine aspect of their lives, mathematics will become a useful tool to assist them in their systematic and intellectual understanding of their environment.

## Quantity

*Quantitatively literate people use numbers to describe phenomena in all aspects of mathematics.*

“Quantitatively literate young need a flexible ability to identify critical relations in novel situations, to express these relations in effective symbolic form, to use computing tools to process information, and to interpret the results of those calculations.” (Steen, p. 65)

Students have a strong desire to measure, code and order things. To this end, some of the outcomes are about single numbers, numbers attached to units of measure, and ordered sets of numbers. Other outcomes are about the interpretation of numbers and of number systems. The use of single numbers and of ordered pairs to describe phenomena in all aspects of mathematics, the natural sciences and the social sciences is very important.

With the growing use of technology to process numerical information, it is becoming essential for students to have a wide range of estimation skills so that they can evaluate whether or not the numerical output provided by a calculator or a computer is a reasonable solution to a given problem.

## Relationships

*The study of mathematics is the development of relationships between and among things.*

The study of mathematics is the development of relationships between and among things. Part of mathematics should help students develop a sense of discovery that mathematicians over the years have felt and should prepare the way for students to make their own discoveries. Students should look for relationships among physical things, as well as the data used to describe those things. Descriptions of the attributes of objects are used to analyze symmetry and congruence and to classify things, using increasingly sophisticated language. Relationships will be described visually, symbolically, orally and in written form.

## Shape

*Shape in mathematics includes geometric representations of algebraic relations, the geometry of maps and the creation of networks of figures.*

Shape in mathematics is central to geometry but also includes geometric representations of algebraic relations, the geometry of maps and the creation of networks of plane figures that can be used to construct 3-D objects. It is very important for students to look for and use similarities, congruences, patterns, transformations, dilatations and tessellations in the solution of a range of problems.

The use of language to describe shapes is an important aspect of mathematics. This description allows for the classification of objects according to various attributes, the naming of objects, and the analysis of objects. The study of shape can be used to build a deductive system, which can assist in further, more detailed analysis. Shape is used in the development of visual models in other disciplines, such as the use of molecular models in chemistry and biology.

The use of technology to analyze and depict shape will increase in importance for students of mathematics as more and better software and hardware become available in classrooms.

## Uncertainty

*Uncertainty involves data, chance, measurements and errors.*

Uncertainty involves data, chance, measurements and errors. Problems dealing with data, together with numbers in context found in the mass media, can be solved within the school mathematics program so long as the data provided and the problems posed have some meaning and relevance to students.

Chance deals with the predictable and the unpredictable outcomes of events. Students from an early age are expected to deal with the concept of chance. As they mature, the language they use

to describe chance becomes more sophisticated and involves the vocabulary of probability theory.

When dealing with random events and complex experiments, students can generate large quantities of data requiring analysis. The use of various technologies enables the student to summarize data easily and to create a visualization of the data to help identify patterns in the information. In some instances the functions describing patterns are linear, periodic, logarithmic or exponential, and senior high school students are expected to use the appropriate algebraic structures to model the information contained within the pattern.

The quality of the output information is directly related to the quality of the input data. The study of uncertainty allows students to assess the reliability of input data, and to learn the processes whereby input data is converted to output information.

## STRANDS

- *Number*
- *Patterns and Relations*
- *Shape and Space*
- *Statistics and Probability*

The student outcomes are organized within four strands. The strands are the formal aspects of the discipline of mathematics that form the foundation of the program of studies and act as connections across the grades. Four strands have been identified for the program of studies to reinforce the interrelationship of mathematical concepts and skills. These strands are split into substrands. However, any such grouping into strands and substrands is for organizational purposes only, and does not reflect the connections among the strands and the underlying themes running throughout all of mathematics.

## Number

### Number Concepts

*Students will:*

- use numbers to describe quantities
- represent numbers in multiple ways.

### Number Operations

*Students will:*

- demonstrate an understanding of and proficiency with calculations
- decide which arithmetic operation or operations can be used to solve a problem and then solve the problem.

## Patterns and Relations

### Patterns

*Students will:*

- use patterns to describe the world and to solve problems.

### Variables and Equations

*Students will:*

- represent algebraic expressions in multiple ways.

### Relations and Functions

*Students will:*

- use algebraic and graphical models to generalize patterns, make predictions and solve problems.

## Shape and Space

### Measurement

*Students will:*

- describe and compare everyday phenomena, using either direct or indirect measurement.

## 3-D Objects and 2-D Shapes

*Students will:*

- describe the characteristics of 3-D objects and 2-D shapes, and analyze the relationships among them.

### Transformations

*Students will:*

- perform, analyze and create transformations.

## Statistics and Probability

### Data Analysis

*Students will:*

- collect, display and analyze data to make predictions about a population.

### Chance and Uncertainty

*Students will:*

- use experimental or theoretical probability to represent and solve problems involving uncertainty.

## STUDENT EXPECTATIONS

The content of the program of studies is stated in terms of outcomes. These outcomes are measurable and identify what students are required to know and be able to do.

The outcomes are developed and based on the expectation that they are appropriate to a large majority of the students. There may be some time delays between where students first encounter the learning and where they are expected to demonstrate knowledge of, or mastery in, that learning.

*Student expectations are described in terms of:*

- *general outcomes*
- *specific outcomes*
- *illustrative examples.*

## General Outcomes

General outcomes are general statements that identify what students are expected to know and be able to do upon completion of a course.

## Specific Outcomes

Specific outcomes are statements identifying the component knowledge, skills and attitudes of a general outcome.

## Illustrative Examples

Illustrative examples are sample tasks that demonstrate and elaborate on the general and specific outcomes. They are important in conveying the richness, breadth and depth intended in the outcomes. The illustrative examples are for discretionary use.

## SUMMARY

The components of the conceptual framework for Kindergarten to Grade 12 mathematics, as described, dictate what should be happening in mathematics education. The components are not meant to stand alone, but are to be interrelated to enhance one another. Activities that take place in the classroom should stem from a problem-solving approach built upon the seven mathematical processes. These processes lead students to an understanding of the nature of mathematics through specific knowledge, skills and attitudes related to each of the strands.

## INSTRUCTIONAL FOCUS

### SUGGESTED TIME ALLOTMENTS

The program of studies is arranged into four strands, each of significance. Therefore, considerable time should be spent on the concepts and processes identified in each strand.

Several additional considerations are important.

- Integration of the mathematical processes, within each strand, is encouraged and expected.
- By decreasing emphasis on rote calculation, drill and practice, and the size of numbers used in paper and pencil calculations, more time is available for concept development.
- Problem solving, reasoning and connections are vital to increasing mathematical power and must be integrated throughout the program. A minimum of half the available time within all strands needs to be dedicated to activities related to these processes.
- There is to be a balance between estimation and mental mathematics, paper and pencil exercises and the appropriate use of technology, including calculators and computers. Concepts should be introduced, using manipulatives, and gradually developed from the concrete to the pictorial to the symbolic.
- There is an assumption made that all students have regular access to appropriate technology. For Mathematics 14–24, calculators and standard spreadsheet programs are appropriate.

## CODING OF OUTCOMES FOR MATHEMATICS 14–24

The specific outcomes for Mathematics 14 and Mathematics 24 have been numbered sequentially within each strand.

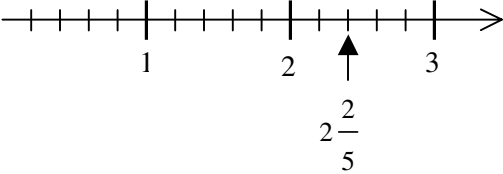

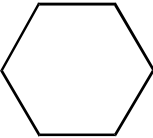

# MATHEMATICS 14

**Strand:** Number (Number Concepts)

*Students will:*

- use numbers to describe quantities
- represent numbers in multiple ways.

- |  |                      |
|--|----------------------|
| [C] Communication                        | [PS] Problem Solving |
| [CN] Connections                         | [R] Reasoning        |

General and Specific Outcomes	Illustrative Examples [Discretionary]
<p><b>General Outcome</b></p> <p>Develop and demonstrate a number sense for rational numbers, decimals, common fractions, integers and whole numbers.</p> <p><b>Specific Outcomes</b></p> <p>1. Demonstrate and explain the meaning of fractions, concretely, pictorially and symbolically. [C, CN, R, V]</p>	<p>1.1 a) Have students work with fractions that represent:</p> <ul style="list-style-type: none"> <li>• part of a group; e.g., <math>\frac{1}{3}</math> of the group were boys</li> <li>• part of a whole; e.g., <math>\frac{1}{2}</math> of the pizza has pineapple on it</li> <li>• a measurement; e.g., a point on a number line</li> </ul> <div style="text-align: center;">  </div> <p>b) Have students work with common fractions; e.g., halves, thirds, fourths, fifths, sixths, eighths, tenths, hundredths.</p> <p>c) Have students use manipulatives to demonstrate that fractions may be less than one or greater than one.</p> <p>1.2 Show that one half is equivalent to three sixths, using the following figure.</p> <div style="text-align: center;">  </div> <p>Add and trace more pattern blocks to make a new figure that shows:</p> <ol style="list-style-type: none"> <li>one fifth is equivalent to two tenths</li> <li>six eighths is equivalent to three fourths.</li> </ol>

**Strand:** Number (Number Concepts)

*Students will:*

- use numbers to describe quantities
- represent numbers in multiple ways.

- [C] Communication      [PS] Problem Solving  
[CN] Connections      [R] Reasoning  
[E] Estimation and      [T] Technology  
Mental Mathematics    [V] Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
	<p>1.3 Use fraction circles to show one half. What equivalent names match your choices? Give three other names equivalent to one half. Identify fraction circles that show two thirds. Name a fraction that is greater than one half but less than two thirds. How could you use fraction circles to show your reasoning?</p>  <p>1.4 Let the base-10 flat represent one whole square. Use centimetre cubes to build a one-layer shape that is less than one whole square. Record your shape on cm grid paper. Write a fraction and a decimal to tell how much of the square is covered by your shape and how much is not covered by your shape.</p> <p>1.5 With the help of pattern blocks, and using the value of the yellow hexagon as one whole, make a pattern with a value of <math>2\frac{1}{2}</math>.</p> <p>1.6 The following diagram is made from pattern block pieces. If the shaded area has a value of <math>\frac{1}{3}</math>, what is the value of the whole design? Make a design with a value of eleven thirds. Rearrange the blocks to show eleven thirds as a mixed number.</p> 

**Strand:** Number (Number Concepts)

*Students will:*

- use numbers to describe quantities
- represent numbers in multiple ways.

- [C] Communication      [PS] Problem Solving  
[CN] Connections      [R] Reasoning  
[E] Estimation and      [T] Technology  
Mental Mathematics    [V] Visualization

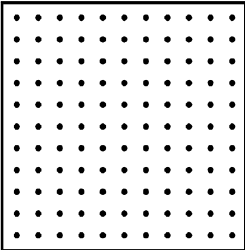

General and Specific Outcomes	Illustrative Examples [Discretionary]										
<p>2. Demonstrate and explain the meaning of ratio concretely, pictorially and symbolically. [C, CN, R, V]</p> <p>3. Represent and apply fractions as per cents, and per cents in fraction or decimal form. [CN, E, PS, R, T]</p>	<p>2.1 Dennis linked 10 cubes together in this order:</p> <table border="1" data-bbox="712 516 1287 575"><tr><td>G</td><td>G</td><td>G</td><td>G</td><td>Y</td><td>G</td><td>G</td><td>G</td><td>G</td><td>Y</td></tr></table> <p>What ratio describes: 2:8 4:1 8:10</p> <p>Suppose Dennis continued the pattern to cover a 10 by 10 grid. How would the ratios change? How would you use per cent to describe:</p> <p>a) the green area? b) the area not green? c) the yellow area?</p> <p>Would it be true to write the following about the yellow area?</p> $0.20 = \frac{2}{10} = \frac{1}{5}$ <p>Explain. Sketch and label a 5-cube sequence. Describe the colours in different mathematical ways.</p> <p>2.2 A fruit punch is made by mixing 3 L of pop with 1 L of orange juice. Model the situation with two different coloured tiles. Find the amount of pop required for 2 L, 3 L and 4 L of orange juice. Write each case as a ratio.</p> <p>3.1 Have students bring in examples of ratios, per cents, decimals and fractions from newspapers or magazines, or by searching the Internet. Discuss with the class why the chosen form was used in each case. Does one form tend to be used more often in particular types of media?</p> <p>Adapted with permission of the British Columbia Ministry of Education.</p>	G	G	G	G	Y	G	G	G	G	Y
G	G	G	G	Y	G	G	G	G	Y		

**Strand:** Number (Number Concepts)

*Students will:*

- use numbers to describe quantities
- represent numbers in multiple ways.

- [C] Communication      [PS] Problem Solving  
[CN] Connections      [R] Reasoning  
[E] Estimation and      [T] Technology  
Mental Mathematics    [V] Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
	<p>3.2 Give students lists of fractions and decimals to arrange in numerical order and place on a number line. Have students develop lists of rules based on their work, which they can use to place numbers in order.</p> <p>a) Can students correctly order and place numbers? b) Do they make conversions correctly? c) Do the rules they identify accurately reflect the process?</p> <p>Reproduced with permission of the British Columbia Ministry of Education.</p> <p>3.3 Have students use a chart to represent numbers taken from real-life data in as many ways as possible; e.g., ratio, fraction, per cent, decimal.</p> <p>3.4 Have students practise calculating common percentages mentally; e.g., 7%, 15%, 25%, 50%.</p> <p>a) What is the GST on a \$90 pair of running shoes? b) If 25% of the 600 people at a basketball game are with the visiting team, how many people is this?</p> <p>3.5 Simulation: The stock market. Choose ten stocks that students are familiar with from the Toronto Stock Exchange. Give students a fictional amount of money to invest and have them track the movement of the stocks each day. Then, by converting to decimal fractions and per cents, have them calculate how much money they have made or lost.</p> <p>Adapted with permission of the British Columbia Ministry of Education.</p> <p>3.6 Let the largest possible square on an 11 by 11 pin geoboard have a value of 1. Construct a different (noncongruent) shape for each part named below:</p> <p>a) 0.25 of the square b) <math>\frac{1}{4}</math> of the square c) 25% of the square.</p>  <p>Record, colour and label each shape on geodot paper. How is each coloured part the same? Shannon outlined a new shape. She says the ratio of the coloured part to the whole square is 3:5. Record and colour one possible shape Shannon might have used. Record other ways to name this shape as part of 1.</p>

**Strand:** Number (Number Operations)

*Students will:*

- demonstrate an understanding of and proficiency with calculations
- decide which arithmetic operation or operations can be used to solve a problem and then solve the problem.

- |  |                      |

General and Specific Outcomes	Illustrative Examples [Discretionary]
<p><b>General Outcome</b></p> <p>Apply arithmetic operations on common fractions, decimals and integers, and illustrate their use in solving problems.</p> <p><b>Specific Outcomes</b></p> <p>4. Use estimation strategies to justify or assess the reasonableness of calculations. [C, E, PS, R]</p> <p>5. Demonstrate an understanding of and proficiency with adding, subtracting, multiplying and dividing decimals (for more than 2-digit divisors or multipliers, the use of technology is expected). [E, PS, T]</p>	<p>4.1 Liam bought 3 equally priced CDs and a tape priced at \$11.95. He paid \$71.20 in total. Before you calculate the exact cost of each CD, explain why it must be less than \$20.00. What was the cost of each CD? Estimate the GST on the total.</p> <p>5.1 Apples cost \$1.39 per kilogram. If you have \$6.00, can you purchase a 3.75 kg bag of these apples? Explain how you could make an estimate to be sure, before you purchase the apples. Find the exact cost of the apples.</p> <p>5.2 Revalue the base-10 blocks. For example, let the “flat” represent one. Then the “long” represents one tenth, and the “unit” represents one hundredth. The diagram below shows the multiplication <math>3.2 \times 2.4</math>.</p> <div style="text-align: center;"> <math>3.2 \times 2.4</math> </div> <div style="text-align: center;"> </div> <p>Use base-10 blocks and this diagram to find the product, and explain your procedure.</p> <p>5.3 Jacques bought 13.2 m of fabric to make tablecloths. Each cloth takes 2.4 m of fabric. How many tablecloths can he make? Use base-10 blocks to find the answer. Explain how your answer is related to the answer you get on your calculator.</p>

**Strand:** Number (Number Operations)*Students will:*

- demonstrate an understanding of and proficiency with calculations
- decide which arithmetic operation or operations can be used to solve a problem and then solve the problem.

- [C] Communication      [PS] Problem Solving  
 [CN] Connections      [R] Reasoning  
 [E] Estimation and      [T] Technology  
 Mental Mathematics    [V] Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
<p>6. Demonstrate an understanding of integers and use arithmetic operations to solve problems involving integers. [PS, V, T]</p> <p>7. Apply order of operations to solve problems, using paper and pencil or a calculator. [PS, T, V]</p>	<p>6.1 Show how you can use two different coloured cubes to represent the following numbers, and combine them.</p> <p><math>(+10) + (-6) =</math>  <math>(-4) + (-7) =</math>  <math>(-8) + (+5) =</math></p> <p>6.2 Calvin put equal numbers of white and black cubes in a container to make a neutral charge. He then put in 6 white cubes to make a charge of <math>-6</math>. From this container he removed four black cubes and wrote <math>(-6) - (+4) = (-10)</math>. Show why this is true and use a similar method to find:</p> <p><math>(+5) - (-2)</math>  <math>(-3) - (-5)</math>  <math>(+7) - (+6)</math></p> <p>6.3 Hoang explained <math>(+5) \times (-2)</math> as <u>putting</u> 5 groups of 2 white chips each <u>into</u> a container for a product of <math>-10</math>. He explained <math>(-6) \times (+4)</math> as <u>taking</u> 6 groups of 4 black chips <u>out</u> of a neutral container for a product of <math>-24</math>. Using Hoang's reasoning, demonstrate and explain <math>(-3) \times (-5)</math> and <math>(+7) \times (+6)</math>.</p> <p>6.4 The temperature fell <math>2^\circ\text{C}</math> per hour for a total temperature change of <math>-10^\circ\text{C}</math>. How many hours did this take?</p> <p>6.5 Extend the following pattern, and describe the rule that is used. <math>-3, 6, -12, \dots</math></p> <p>6.6 Provide an answer and have students suggest as many questions as they can that would result in that answer; e.g.:  <math>A = 6, Q = 2 + 4, 3 \times 2, 20 - 14, 24 \div 4 \dots</math></p> <p>Adapted with permission of the British Columbia Ministry of Education.</p> <p>6.7 The temperature in the morning was <math>7^\circ\text{C}</math>. By noon the temperature went up <math>9^\circ\text{C}</math>. By late afternoon it fell <math>5^\circ\text{C}</math>, and by midnight it dropped another <math>9^\circ\text{C}</math>. What is the final temperature?</p> <p>7.1 Determine the missing operation signs so that the following statement is true.  <math>(7.4 \square 2.1) \square 14 = 1.11</math></p> <p>7.2 Place parentheses in the following equation to make it true.  <math>4 + 5 \times 3 - 8 = 19</math></p>

**Strand:** Number (Number Operations)

*Students will:*

- demonstrate an understanding of and proficiency with calculations
- decide which arithmetic operation or operations can be used to solve a problem and then solve the problem.

Mental Mathematics    [V] Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
8. Demonstrate an understanding of and proficiency with adding, subtracting, multiplying and dividing fractions concretely, pictorially and symbolically. [E, PS, V]	8.1 Eric ordered several large pizzas for a party. $1\frac{1}{2}$ pepperoni pizzas and $\frac{2}{3}$ of a pineapple pizza were not eaten. Was there the equivalent of more than two large pizzas left over? Explain how you can estimate the answer. Solve using a pencil and paper method, and use paper circles to explain your method and your answer.  8.2 Mr. Blair’s gas tank was $\frac{7}{8}$ full when he left home. He knows he will use $\frac{3}{4}$ of a tank of gas on his errands. Will he have enough fuel to do his errands. Use fraction strips to explain your method and your answer.  8.3 Lisa had $\frac{3}{4}$ of a large candy bar. She gave $\frac{1}{3}$ of what she had to Shannon. Explain how you know that Shannon got less than $\frac{1}{3}$ of a whole bar by: a) using a pencil and paper method b) folding a piece of paper that represents a whole candy bar.  8.4 Miko has $2\frac{1}{2}$ m of blue cloth. How many pieces $\frac{1}{4}$ m long can she cut from her piece? Estimate the answer and explain the solution by: a) using a pencil and paper method b) using manipulatives.  8.5 In the community hall, $\frac{1}{4}$ of the people present are men, $\frac{1}{3}$ are women and the rest are children. There are 840 people in the hall. How many children are there?

General and Specific Outcomes	Illustrative Examples [Discretionary]
10. Derive and apply unit rates. [PS, R]	10.1 A carpenter bought 2.5 kg of nails. The total cost was \$3.75. What was the cost of 1 kg?  10.2 Toothpaste is advertised as 75¢ for a 50 mL tube. A 75 mL tube is priced at \$1.09. Which is the better buy? Why?  10.3 Compare values, using flyers from two grocery outlets.  10.4 Have students compare the cost of 1 kg of bulk peanuts with the cost of 1 kg of peanuts bought in smaller packages.  10.5 Travelling from Saskatoon to Regina, a distance of 276 km, took 3 hours. What was the rate of speed in km/hr?  10.6 Mark drove from Seattle to Portland, a distance of 124 miles, in 2 hours. What was his rate of speed in miles per hour?
11. Express rates and ratios in equivalent forms to solve problems. [PS, R, T]	11.1 Gas usage is expressed as the rate of the number of litres of gas used per 100 km. On a 225 km trip, Nadia used 20.5 L of gas. Express her usage in terms of the above rate. Why do you think this type of rate is used?  11.2 While visiting the California coast, Theresa drove 270 miles. If she used $11\frac{1}{2}$ gallons of gas, what was her rate of gas use? Express your answer in miles per gallon.  11.3 In Canada, there are 1 million curlers registered in 1200 clubs. In Scotland, there are 50 000 curlers in 52 clubs, and in Sweden there are 9000 curlers in 36 clubs. Write a ratio for each to compare the number of curlers to the number of clubs, and arrange these in order of size from least to greatest.

**Strand:** Number (Number Operations)

*Students will:*

- demonstrate an understanding of and proficiency with calculations
- decide which arithmetic operation or operations can be used to solve a problem and then solve the problem.

General and Specific Outcomes	Illustrative Examples [Discretionary]										
4. Substitute numbers for variables in expressions, and graph and analyze the relation. [C, PS, R, V]	4.1 Mitch got a job at “Ease-a-phone,” a new cellular telephone company. He will be paid \$20 a day plus \$8.50 for every new customer he signs to an “Ease-a-phone” contract. Mitch used the expression $E = 20 + 8.5C$ to determine his earnings per day—E stands for earnings, and C stands for new contracts. <table border="1" data-bbox="721 659 1295 730" style="margin-left: auto; margin-right: auto;"> <tr> <td style="padding: 2px 10px;">C</td> <td style="padding: 2px 10px;">0</td> <td style="padding: 2px 10px;">1</td> <td style="padding: 2px 10px;">2</td> <td style="padding: 2px 10px;">...</td> </tr> <tr> <td style="padding: 2px 10px;">E</td> <td style="padding: 2px 10px;">20</td> <td style="padding: 2px 10px;">28.50</td> <td style="padding: 2px 10px;">37.00</td> <td style="padding: 2px 10px;">...</td> </tr> </table> <p>a) Which variable is dependent? On which axis will it go?            b) Continue Mitch’s chart and make a graph to show the relationship.            c) Will you join the points on the graph with a line? Explain.            d) Discuss the pros and cons to this kind of earnings arrangement.</p> 4.2 An expression for the mass of two cans and five bearings is $2c + 5b$ . Find the total mass, if each can has a mass of 200 g and each bearing has a mass of 75 g. 4.3 A formula for finding the perimeter of a rectangle is $P = 2l + 2w$ . Find the perimeter when $l$ is 8 cm and $w$ is 6 cm.	C	0	1	2	...	E	20	28.50	37.00	...
C	0	1	2	...							
E	20	28.50	37.00	...							
5. Translate between an oral or written expression and an equivalent algebraic expression. [C, CN]	5.1 Write an algebraic expression for the following: Force equals mass times acceleration. 5.2 Describe the following algebraic equations in words. a) $A = \frac{1}{2}bh$ b) $P = 2l + 2w$ 5.3 Carl has 30 coins, all dimes and quarters. Write an expression to represent the number of dimes, if he has $x$ quarters.										

**Strand:** Patterns and Relations (Variables and Equations)

*Students will:*

- represent algebraic expressions in multiple ways.

General and Specific Outcomes	Illustrative Examples [Discretionary]
<p><b>General Outcome</b></p> <p>Estimate, measure and compare, using decimal numbers or fractions and standard imperial and SI units of measure.</p> <p><b>Specific Outcomes</b></p> <p>1. Select and use appropriate measuring devices and measurement units for direct measurements (in imperial or SI units) including:</p> <ul style="list-style-type: none"> <li>• length/perimeter</li> <li>• area</li> <li>• volume/capacity</li> <li>• mass</li> </ul> <p>to solve problems. [PS, CN, R, T]</p> <p>2. Estimate measurements of objects in SI and imperial systems including:</p> <ul style="list-style-type: none"> <li>• length/perimeter</li> <li>• area</li> <li>• volume/capacity</li> <li>• mass.</li> </ul> <p>[R, CN, E]</p> <p>3. Solve problems involving linear dimensions, area and volume. [CN, PS, V]</p>	<p>1.1 Use a micrometre to measure the thickness of 10 sheets of paper. Use the results of this measurement to determine the thickness of one sheet of paper.</p> <p>1.2 Fill three different empty tin cans with sand; e.g., a drink can, a soup can and a tuna can. Estimate the weight/mass of each. Use standard weights/masses and a balance scale to check your estimates.</p> <p>1.3 Ask students to find objects that have a mass that is less than, more than and equal to 1 kilogram. Ask them to find objects that have a weight that is less than, more than and equal to 1 pound. Have them measure, record, compare and order the masses and weights. (This could be expanded to a scavenger hunt for objects of any given measurement.)</p> <p>1.4 Ask students to construct an object, using modelling clay, that is a pound/kilogram. Have them measure to determine accuracy and share their strategies for determining the weight/mass of their modelling clay object.</p> <p>2.1 Estimate the volume of a water bed bladder having a depth of 12 inches, a width of <math>5\frac{1}{2}</math> feet and a length of 80 inches.</p> <p>3.1 Calculate the area of a flat rectangular surface measuring 21 feet by 14 feet.</p> <p>3.2 Measure the internal dimensions of a rectangular container, and calculate its volume in <math>\text{cm}^3</math>. Find its volume in litres, and verify using a calibrated cylinder.</p>

<b>General and Specific Outcomes</b>	<b>Illustrative Examples [Discretionary]</b>
<p><b>General Outcome</b></p> <p>Apply indirect measurement procedures to solve problems.</p> <p><b>Specific Outcomes</b></p> <p>12. Use concrete materials and diagrams to verify the Pythagorean relationship. [CN, R]</p>	<p>11.1 The pointed end on the minute hand of a clock travels 132 cm each hour. How long is the minute hand?</p> <p>11.2 If Nel’s bicycle wheel is 28 inches in diameter, how far can Nel go in one revolution? How far can she go in 10 revolutions?</p> <p>12.1 Tara is investigating the relationship among the three sides of a right triangle. She drew a right triangle in the middle of a sheet of grid paper and then constructed a square on each side of the triangle. Then she tried to cut the two smaller squares and fit them on the largest square. Try Tara’s investigation, using right triangles with different shapes. Explain what you find.</p> <p>12.2 Ask students to estimate the perimeters and surface areas of composite shapes and objects, like the ones below, then measure, calculate and compare the derived values with their estimates. Have students use their journals to reflect on the differences between their estimates and the actual measurements. Students could use drafting software to check their estimates.</p> <div data-bbox="743 1325 1406 1560"><p>The first diagram shows a square with a side length of 4 m. A semicircle is attached to the top side, with a diameter of 4 m. A right-angled triangle is attached to the right side of the square, with a vertical leg of 4 m and a horizontal leg of 3 m. The second diagram shows a U-shaped polygon. The top horizontal side is 7 m long. The two vertical sides on the right are 4 m high. The two vertical sides on the left are 2 m high. The bottom horizontal side is 2 m long.</p></div>

 [E] Estimation and      [T] Technology  
     Mental Mathematics      [V] Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]																
<p>13. Use the Pythagorean relationship to calculate the measure of the third side, of a right triangle, given the other two sides in 2-D applications. [PS, T]</p>	<p>12.3 Divide a piece of rope or string into 12 equal lengths, by placing tape on 13 spots. Ask three students to hold the rope in a way that constructs a triangle with a right angle—each student represents a vertex; one student holds the two ends of the rope together. Students should discover that there is only one solution. Discuss:</p> <p>a) Can any other right triangle be made?                      b) Does 3, 4, 5 always result in a right triangle?                      c) What are the applications?</p> <p>Challenge students to design another way to divide a rope that produces a right triangle; e.g., 5, 12, 13=30 parts; 7, 24, 25=56 parts. Students could use a calculator to find the triples.</p> <p>Adapted with permission of the British Columbia Ministry of Education.</p>																
	<p>12.4 Ask students to generate their own charts of Pythagorean triples and their multiples. For example:</p> <table border="1" data-bbox="716 1024 1442 1234"> <thead> <tr> <th>Original Triple</th> <th>Times 2</th> <th>Times 3</th> <th>Times 10</th> </tr> </thead> <tbody> <tr> <td>3, 4, 5</td> <td>6, 8, 10</td> <td>___, ___, ___</td> <td>___, ___, ___</td> </tr> <tr> <td>5, 12, 13</td> <td>___, ___, ___</td> <td>15, 36, 39</td> <td>___, ___, ___</td> </tr> <tr> <td>7, 24, 25</td> <td>___, ___, ___</td> <td>___, ___, ___</td> <td>70, 240, 250</td> </tr> </tbody> </table> <p>Reproduced with permission of the British Columbia Ministry of Education.</p>	Original Triple	Times 2	Times 3	Times 10	3, 4, 5	6, 8, 10	___, ___, ___	___, ___, ___	5, 12, 13	___, ___, ___	15, 36, 39	___, ___, ___	7, 24, 25	___, ___, ___	___, ___, ___	70, 240, 250
	Original Triple	Times 2	Times 3	Times 10													
	3, 4, 5	6, 8, 10	___, ___, ___	___, ___, ___													
5, 12, 13	___, ___, ___	15, 36, 39	___, ___, ___														
7, 24, 25	___, ___, ___	___, ___, ___	70, 240, 250														
<p>13.1 Jamie wants to walk from one corner of the rectangular playing field to the opposite corner. The playing field is 90 feet by 150 feet. What is the shortest route he can take? Explain.</p> <p>13.2 Invite students to find right triangles in the classroom. For each triangle, have students measure two of the sides and then use the Pythagorean relationship to calculate the third side. Are their calculations accurate? Can they explain the process?</p> <p>Reproduced with permission of the British Columbia Ministry of Education.</p>																	
<p>13.3 Provide pairs of students with a list of things to measure using the Pythagorean relationship. Ask students to compare their measurements in class and discuss the reasons for possible differences. Are the measurements reasonable? How plausible are their explanations of possible reasons for differences?</p> <p>Reproduced with permission of the British Columbia Ministry of Education.</p>																	

**Strand:** Statistics and Probability (Data Analysis)

*Students will:*

- collect, display and analyze data to make predictions about a population.

General and Specific Outcomes	Illustrative Examples [Discretionary]
<p>8. Use spreadsheet software applications to analyze leasing or buying a decreasing asset (vehicle, computer) under different sets of circumstances. [C, PS, T]</p> <p>9. Analyze car, property or house insurance needs and premiums, using such concepts as loss, compulsory coverage, optional coverage, deductible and claims record. [CN, E, R, T]</p>	<p>8.1 A car costs \$15 366.05. A lease for the car runs for 36 months at \$305 per month, with a down payment of \$1 105, a lease-end value of \$7105 and an interest rate of 11.6%. The mileage restriction is 25 000 km/year. Excess mileage will cost 8¢/km. Maintenance is the purchaser's responsibility. Set up a spreadsheet to include the monthly value of the opening balance, payment, interest rate, interest paid, principal paid and closing balance.</p> <p>a) If the vehicle is purchased at lease-end, find the total cost. b) How much interest is paid? c) If the car has 85 827 km at the end of the lease and the car is not purchased, what will the extra kilometres cost?</p> <p>8.2 Create another spreadsheet on the same car as described in illustrative example 8.1 but with a 20% down payment and an interest rate of 11.6%. Adjust the payments so that the straight purchase loan is paid totally in 36 months. Answer 8.1a and 8.1b again.</p> <p>9.1 Obtain from an insurance company the dollar values that are paid out for inexperienced drivers and for experienced drivers in the categories of liability, collision and comprehensive theft/glass.</p> <p>Calculate the insurance premium for \$1 000 000 liability, \$500 deductible collision and \$100 deductible comprehensive theft/glass coverage. Do the calculations twice, once for each type of driver.</p> <p>What change in premium would you expect, if the deductible for collision were raised to \$1000?</p> <p>9.2 At what point is it worth it to drop collision coverage on an older vehicle? Show a strategy, and explain the supporting calculations.</p>

**Strand:** Number (Number Operations)

**Strand:** Statistics and Probability (Data Analysis)

*Students will:*

- collect, display and analyze data to make predictions.

- |  |                      |

General and Specific Outcomes	Illustrative Examples [Discretionary]
<p><b>Specific Outcomes</b></p> <p>6. Select, defend and use appropriate methods of collecting data:</p> <ul style="list-style-type: none"> <li>• designing and using questionnaires</li> <li>• interviews</li> <li>• experiments</li> <li>• research.</li> </ul> <p>[C, PS, T]</p> <p>7. Design different ways of presenting data and analyzing results, by focusing on the truthful display of data and the clarity of presentation.</p> <p>[C, CN, T, V]</p>	<p>6.1 As a member of your school’s student council, you wish to determine the number of students who will attend a school dance. Explain how you could collect this information.</p> <p>6.2 A city council is trying to determine if a major road in your district needs to be widened. Explain a procedure that could be used to help city council make this decision.</p> <p>6.3 Bill surveyed people entering a theatre and asked them if they would support building a new sports arena in the community. Discuss this method of collecting data in terms of its appropriateness.</p> <p>7.1 The amount of money Company A made doubled in 6 months. The following 4 graphs were given.</p> <p>i) </p> <p>ii) </p> <p>iii)  January      July</p> <p>iv)  January      July</p> <p>a) Which graph best represents the situation? b) Explain what is wrong with each of the other graphical representations and why they do not represent the situation.</p>

**Strand:** Statistics and Probability (Data Analysis)

*Students will:*

- collect, display and analyze data to make predictions about a population.

- |                                       |                      |

**General and Specific Outcomes**

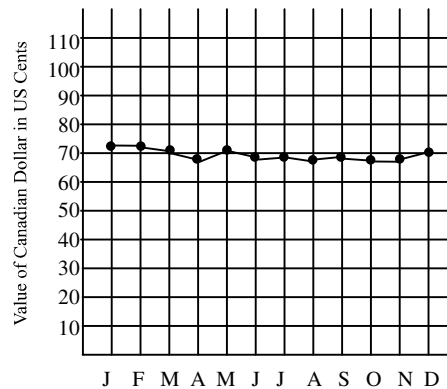

**Illustrative Examples [Discretionary]**

- 7.2 The value of the Canadian dollar in terms of US cents is given in the following chart. These values are recorded in graphs A and B, which use different vertical scales.
- Do both graphs display the same data?
  - Which graph is easier to read?
  - Compare the vertical scales. How do they differ?
  - What message is delivered by Graph A? by Graph B? Discuss the differences.

Value of Canadian Dollar in US Cents

January	70.2
February	70.2
March	70.1
April	69.8
May	70.1
June	69.5
July	69.4
August	68.9
September	69.5
October	68.8
November	68.8
December	70.0

Graph A

Graph B

**Strand:** Statistics and Probability (Chance and Uncertainty)

*Students will:*

- use experimental or theoretical probability to represent and solve problems involving uncertainty.

[C] Communication      [PS] Problem Solving  
 [CN] Connections      [R] Reasoning  
 [E] Estimation and      [T] Technology  
 Mental Mathematics    [V] Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
<p><b>General Outcome</b></p> <p>Compare theoretical and experimental probability of independent events.</p> <p><b>Specific Outcomes</b></p> <p>8. Compare experimental results with theoretical results. [C, E, R]</p> <p>9. Calculate theoretical probability, using numbers between 0 and 1. [E, PS]</p> <p>10. Recognize that if <math>n</math> events are equally likely the probability of any one of them occurring is <math>\frac{1}{n}</math>. [R]</p>	<p>8.1 You have a cube with faces numbered 1 to 6. a) What is the theoretical probability of rolling: a 6? a 4? a 1? b) Perform an experiment with a die and compare the results.</p> <p>8.2 Ask students to work in groups to develop hypotheses that they can test; e.g., probability of selecting a given coloured candy from a bag when the quantities of each colour are known. Have groups calculate the theoretical probabilities, then conduct experiments to test their hypotheses.</p> <p>Reproduced with permission of the British Columbia Ministry of Education.</p> <p>8.3 Invite an insurance agent to discuss with the class how insurance companies incorporate independent events in the calculation of premiums.</p> <p>Reproduced with permission of the British Columbia Ministry of Education.</p> <p>9.1 There are 350 door prize tickets sold. If you buy 5 tickets, what is the probability of you winning the 1<sup>st</sup> prize drawn?</p> <p>10.1 If you toss one standard die, what are the possible outcomes? Are they equally likely? Explain. Write the probability of tossing a 4. If you did the same experiment with a 12-sided die, what would be the probability of tossing a 4?</p> <p>10.2 If you draw a card from a deck, what suit could it be? Are all suits equally likely? What is the probability of drawing a heart?</p> <p>10.3 Sherry takes a 100-item multiple-choice examination. Each item has four possible choices. She knows 68 of the answers and guesses randomly at the other 32. Calculate her expected number of correct answers.</p>
